#### Learning objectives

#### An overview of:

- Mathematics underlying encryption.
- Extremely simple explanations.
- Real-world encryption uses huge numbers:
- Example: 600 digits; 2000 bits.
- We work with smallest possible quantities for learning purpose.
- We provide examples of:
  - Prime numbers.
  - Generators.
  - Modular arithmetic.
  - Symmetric key encryption.
  - Public key encryption.
  - Hashing

## Number Theory

The briefest of introductions

Number Theory

Prime number

- Natural numbers: whole numbers: 0, 1, 2, 3, . . .
- Prime: natural number divisible only by itself and one.
- Examples of primes: 2, 3, 5, 7, 11, 13
- 4 is not prime because it is divisible by 2.
- Zero and one are not considered primes.

#### Prime number

- There is an infinite number of primes.
- Primes still being discovered.
- Structure of pattern of primes still unsolved.
- In real-world cryptography huge prime numbers are used.
- Typically 600 digits, approximately 2000 bits.
- We will work with very small primes.

Prime number

- All natural numbers are either prime or composite numbers.
- A number not a prime number is a composite.
- Prime: 7 because factors are itself and one only.
- Composite: 8 because factors are 1, 2, 4, 8 and so not prime.

Euclid's discoveries (300 BC)

- Realized all numbers prime or composite.
- Any number repeatedly divisible until set primes arrived at.

• 
$$15 = 3 + 3 + 3$$

• 
$$25 = 5 + 5 + 5 + 5 + 5$$

$$\bullet \ \ 49 = 7 + 7 + 7 + 7 + 7 + 7 + 7 + 7$$

Euclid Fundamental Theorem of Arithmetic)

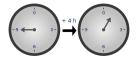

- 30 = 2 x 15 (The prime 2 added 15 times)
- 30 = 3 x 10 (The prime 3 added 10 times)
- $30 = 5 \times 6$  (The prime 5 added 6 times)
- 2, 3 and 5 are the prime factors of 30.

### Euclid Fundamental Theorem of Arithmetic)

- 2 x 3 x 5 is prime factorization of 30.
- Every number has one & only one prime factorization.
- Unique: no two numbers have same factorization.
- Analogy: each number different lock with unique key.
- The unique key: the prime factors.
- No two locks share same key.
- No two numbers share prime same factorization.

#### Modular arithmetic

- Also referred to as clock arithmetic.
- Number wraps around when modulus reached.
- In case of 12-hour clock the modulus is 12
- Valid range numbers is 0 to 11.
- Example modular addition:
  - $9+2 \mod 12=11$
  - $9+3 \mod 12=0$
  - $9+4 \mod 12=1$

#### Modular arithmetic

- Java uses % operator for modular arithmetic.
- Example where modulus is 12:
  - 15 % 12 is 3
  - 3 is the remainder when 15 divided by 12.
  - Also expressed as 15 mod 12
- So 15 mod 12 is congruent to 3.
- Which may be expressed as 15 mod  $12 \equiv 3$ .

# Modular Arithmetic Congruence

What are hashes & how are they generated?

Hash & Hash Algorithms

# Sign your app

## Sign your app Verifying

## Symmetric Key Encryption

Example using one-time pad

Symmetric Key Encryption

## One Time Pad

Key same length as plaintext

## Exclusive OR denoted by $\oplus$ .

- m denotes plaintext or message text
- k denotes key
- c denotes the cipher text or encrypted message
- $c = m \oplus k$

а	b	$a \oplus b$
0	0	0
0	1	1
1	0	1
1	1	0

m	0	1	1	0	1	1
k	1	0	1	1	0	0
С	1	1	0	1	1	1

## One Time Pad

Key same length as plaintext

#### Observe from table:

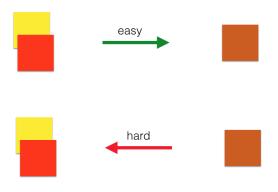

- $c = m \oplus k$
- $m = c \oplus k$

m	0	1	1	0	1	1
k	1	0	1	1	0	0
С	1	1	0	1	1	1
$c \oplus k$	0	1	1	0	1	1

Discovered independently by Diffie & Hellman (Stanford) & Christopher Cocks (GCHQ)

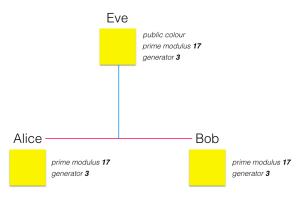

Diffie-Hellman

## Uses One-Way Function

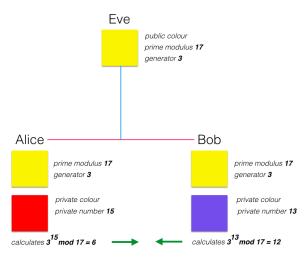

One-Way function

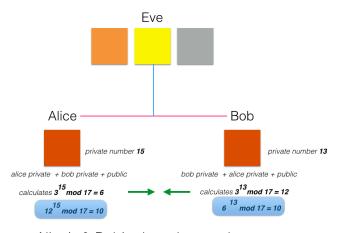

One-Way Function - underlying mathematical theory

### One-Way Function - underlying mathematical theory

One-Way Function - underlying mathematical theory

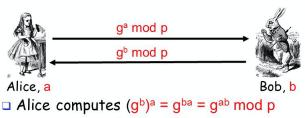

Alice's & Bob's shared secret key

Diffie-Hellman & Christopher Cocks

# Diffie-Hellman

- □ Public: g and p
- Private: Alice's exponent a, Bob's exponent b

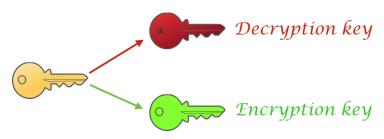

- $\square$  Bob computes  $(g^a)^b = g^{ab} \mod p$
- Use K = g<sup>ab</sup> mod p as symmetric key

Discovered by Rivest, Shamir, Adleman (RSA) & Christopher Cocks (GCHQ)

RSA

#### public-private key pair

- Ron Rivest, Adi Shamir & Leonard Adleman
- Key generator produces two components.
- The private (secret) key (SK) used to decrypt.
- The public key (PK) used to encrypt.
- Keys have inverse functionality.
  - Encrypt with PK => decrypt with SK.
  - Sign (encrypt) with SK => verify (decrypt) with PK.

#### Mathematical explanation

- Let modulus be 14.
- Alice uses key generator to output public-private key pair.
- Gives (somehow) public key to Bob.
  - Private key: (11, 14)
  - Public key: (5, 14)
  - There is a mathematical relationship between the 11 & 5.
  - Explanation: beyond scope of course.
  - Explained in KhanAcademy Brit Cruise course referenced below.

#### Mathematical explanation

Bob encrypts plaintext 2 using public key (5, 14):

$$c = 2^5 mod 14$$
$$= 4$$

Hint: Use Paul Trow's online modular arithmetic calculator:

 ${\tt https://goo.gl/MhfqcO}$ 

Mathematical explanation

Alice uses private key (11, 14) to decrypt c = 4:

$$m = 4^{11} mode 14$$
  
= 2

#### Mathematical explanation

Alice uses private key (11, 14) to sign (encrypt) a message m=2:

$$c = 2^{11} mode 14$$
$$= 4$$

Bob verifies signed message 4 using public key (5, 14):

$$m = 4^5 \mod 14$$
  
= 2 (verified)
